

QUESTION	ANSWER
----------	--------

## Quiz Cards: Energy Changes

### How to use the quiz cards to learn the key facts

- 1) Take 6 quiz cards at a time and read through them
- 2) Cover up the answer side of the page.

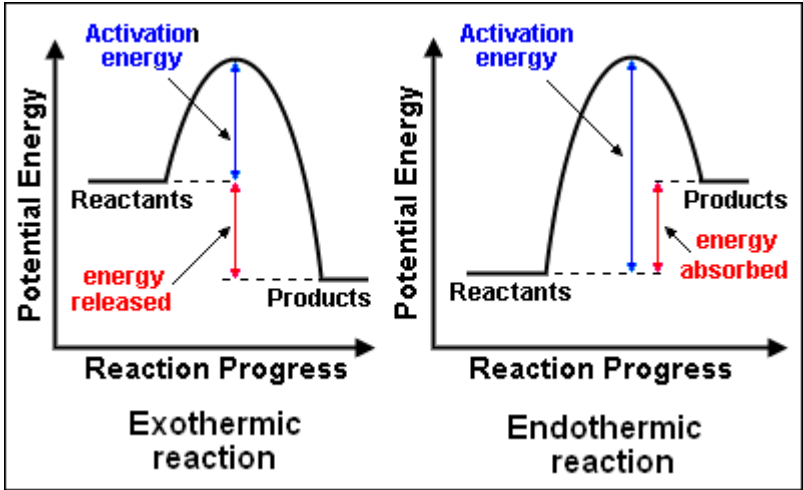

Question	Answer
----------	--------

- 3) Take the first quiz card and ask yourself the question. Either write the answer down or say it out loud.
- 4) Check your answer using the answer side of the card.
- 5) Do this question again until you get it right.
- 6) Repeat the process for the second question.
- 7) Before going onto the third question repeat question one and two.
- 8) When you have gone through all of the questions try and do them in a random order to really test your knowledge.

### **ONCE YOU HAVE LEARNT THEM ALL ....**

- 9) Complete some exam questions to apply your knowledge.
- 10) Check your answer with the mark scheme and correct any errors in green pen.
- 11) Repeat steps 9-10 until you get the answers correct all of the time.

QUESTION	ANSWER
<p><b>What happens to energy during a chemical reaction?</b></p>	<p>Energy is transferred to or from the surroundings (so they get hot or cold).</p>
<p>What is the conservation of energy?</p>	<p>The amount of energy at the end of a chemical reaction is the same as before.</p>
<p><b>What</b> is an exothermic reaction?</p>	<p><b>Exothermic</b> reactions transfer energy to the surroundings – (so <u>give out heat</u>).</p> <p>The product molecules must have less energy than the reactants.</p>
<p><b>What</b> are examples of exothermic reactions?</p>	<p>combustion, many oxidation reactions neutralisation. self-heating cans (e.g. for coffee) hand warmers.</p>
<p><b>What</b> is an endothermic reaction?</p>	<p><u>Take in energy</u> from the surroundings – (so feel cold).</p>
<p><b>What</b> are examples of endothermic reactions?</p>	<p>thermal decompositions some sports injury packs that get cold</p>

QUESTION	ANSWER
<p><b>What</b> is a reaction profile?</p>	<p>Show the relative energies of reactants and products, the activation energy and the overall energy change of a reaction.</p>
<p><b>What</b> is activation energy?</p>	<p>The minimum amount of energy that particles must have to react is called the activation energy.</p>
<p><b>Draw</b> energy level diagrams to represent exothermic and endothermic reactions.</p>	
<p>In terms of energy <b>what</b> happens when bonds are broken?</p>	<p>Energy must be supplied to break bonds in the reactants</p>
<p>In terms of energy <b>what</b> happens when bonds are made?</p>	<p>Energy is released when bonds in the products are formed.</p>
<p><b>What</b> is the overall change in energy of a reaction?</p>	<p>The difference between the sum of the energy needed to break bonds in the reactants and the sum of the energy released when bonds in the products are formed</p>

<b>QUESTION</b>	<b>ANSWER</b>
Compare (in terms of bond energies) exothermic and endothermic reactions.	<p>In an exothermic reaction, the energy released from forming new bonds is greater than the energy needed to break existing bonds.</p> <p>In an endothermic reaction, the energy needed to break existing bonds is greater than the energy released from forming new bonds.</p>
